	Urgent	Not Urgent
Important	• Draw one digit in a Java interface, with Predict and Clear buttons. • Recognize digits from 0–9 using a KNN classifier. • Send drawings to Python through a Flask API and display the returned prediction.	• Use PyTorch and the EMISET dataset to include reading letters. • Personalization of handwriting style • Save corrected handwriting examples to personalize predictions.
Not Important	• Use scikit-learn for the digits dataset and KNN classifier. • Use Pillow and NumPy for image preprocessing. • Use Flask and Java HttpClient for communication between Python and Java.	• Full-page handwriting and cursive recognition. • Mathematical equation recognition and solving. • User accounts and cloud synchronization
